DECLARATION

I, EKENWANEZE, CHRISTOGONUS CHICHEBE, (22PCP02381), declare that this research is an original work carried out by me under the supervision of Professor O.O. Ogunlana in the Department of Biochemistry, College of Science and Technology, Covenant University, Ota Nigeria. I attest that the thesis has not been presented wholly or partially for the award of any degree elsewhere. All sources of materials and scholarly publications used in the thesis have been duly acknowledged.

CERTIFICATION

This is to certify that the research work titled “**ASSOCIATION BETWEEN *CYP17A1* AND *HSD3B1* GENE POLYMORPHISMS AND TESTOSTERONE LEVELS IN NIGERIAN PROSTATE CANCER PATIENTS**” is an original work carried out by **EKENWANEZE, CHRISTOGONUS CHICHEBE (22PCP02381)** meets the requirements and regulations governing the award of Master of Science degree (M.Sc) in Biochemistry from the Department of Biochemistry, College of Science and Technology, Covenant University, Ota, Ogun State, Nigeria. It is approved for its contribution to knowledge and literary presentation.

DEDICATION

This dissertation is dedicated to the Almighty God for His love and guidance throughout the cause of this project.

ACKNOWLEDGEMENT

I thank the Covenant Applied Informatics and Communication Africa Centre of Excellence (CApIC-ACE) for their invaluable support in funding my research. I am genuinely grateful for their belief in my work. Additionally, I wish to extend my deepest gratitude to my parents, Mr and Mrs A.E. Nwaigwe, my siblings Gaemezu, Zobam and Chijioke and nephew and nieces for their unwavering prayers, encouragement and generous financial support, which have been instrumental in making this journey possible. Thank you, Rev. Fr. Bartholomew Chukwu, for your spiritual and moral support.

I also want to thank all my lecturers, especially my supervisor, Prof. O.O. Ogunlana, for her enormous support and guidance throughout my project work. I especially appreciate the HOD and Cancer Genomic group coordinator, Prof. S. Rotimi, and CApIC_ACE Center Director, Professor E. Iweala, for their guidance and support towards my project.

To all members of Accountability Hub and Kingdom Professionals using Barr. Ngunan and Obinna and Mr Chukwunoso and Kenechukwu as points of contact, respectively; I am grateful for all the spiritual support, mentorship and encouragement.

Dear Dr Gwen Okeke, thank you for your unwavering support until your demise, and may your soul continue to rest in peace. Amen

Finally, I appreciate all my colleagues and friends I worked with and assisted each other, enabling me to conduct insightful research.

ABSTRACT

Prostate cancer (PCa) represents a significant worldwide health challenge, being the second most diagnosed cancer and a top cause of cancer-related deaths among men. African men exhibit high PCa incidence and mortality rates. Genetic variation in androgen pathways is essential in PCa development and progression. The Cytochrome P450 17A1 (*CYP17A1*) gene encodes a critical metabolic enzyme involved in testosterone (TT) synthesis, as it converts cholesterol into androstenedione. Similarly, the 3 β -hydroxysteroid dehydrogenase type 1 (*HSD3B1*) gene encodes an enzyme that catalyses the conversion of dehydroepiandrosterone (DHEA) to androstenedione, a critical precursor for TT production. This study aimed to evaluate the frequency of polymorphisms in the *CYP17A1* and *HSD3B1* genes among PCa patients from Southwest Nigeria and to investigate their association with testosterone levels and androgen receptor (AR). The case-control study was conducted on 40 PCa patients and 40 control groups of healthy males with matching ages. Detection of *CYP17A1* and *HSD3B1* polymorphisms was done using TaqMan real-time polymerase chain reaction (RT-PCR), and estimation of TT and AR levels in serum was done using the enzyme-linked immune-sorbent assay (ELISA) technique for all groups. This study identified AA, AG, and GG genotypes of the *CYP17A1* and AA and CA genotypes of *HSD3B1*, and there was no significant association between PCa and control groups of the genes. Testosterone levels were higher in the control group than in the PCa group ($p=0.0015$). There was no association was found between *CYP17A1* gene polymorphisms and TT and AR levels, similar to the *HSD3B1* gene and TT. Conversely, an association was found between the *HSD3B1* heterozygous adrenal-restrictive (CA) and AR, and no *HSD3B1* adrenal-permissive homozygous genotype (CC) was found. The result of this study suggests that the *HSD3B1* gene could be a suggestive prognostic and predictive biomarker of PCa. This would pave the way for future investigations that could influence diagnosis and personalised treatment of PCa.
