

# In collaboration with

## **PRESENTS**

2012 International Conference on Clean Technology & Engineering Management (ICCEM 2012)

### **2012 INTERNATIONAL CONFERENCE**

### ON

# CLEAN TECHNOLOGY AND CONTEMPORARY ENGINEERING MANAGEMENT

**NOVEMBER 12 – 15, 2012** 

**@** 

COVENANT UNIVERSITY, OTA

**CONFERENCE AGENDA** 

Conference Chair: Engr. Prof. F.A Oyawale

Conference Secretary: Engr. S.O Oyedepo

© Mechanical Engineering, Covenant University, Ota, Nigeria

### **CONFERENCE PROGRAMME**

### November 12 - 15, 2012

**Day One:** Monday, November 12, 2012

Venue: Mechanical Engineering Building

2:00pm – 6:00pm: Registration of Participants / Arrival of Invited Guests

**Day Two:** Tuesday November 13, 2012 **Session 1: Plenary Opening Ceremony** 

THEME: INNOVATIONS, CLEAN TECHNOLOGY AND CONTEMPORARY

**ENGINEERING MANAGEMENT** 

Venue: African Leadership Development Center, Covenant University, Ota

10:00am – 10:05am: National Anthem 10:05am – 10:10am: University Anthem

10:10am – 10:15am: Opening Prayer (**University Chaplain**)

10:15am – 10:30am: Introduction of Guests/Dignitaries (**Dr. Ogunsina B.S**)

10:30am – 10:40am: Welcome Address (**Dean CST**)

10:40am – 11:00am: Goodwill Message (**Prof. C.K Ayo**, Vice Chancellor, Covenant

University)

11:00am – 11:05am: Goodwill Message (Engr. M.B Shehu, President, Nigerian Society of

Engineers)

11:05am – 11: 10am: Goodwill Message (Engr. A. Fanimokun, Chairman, Nigerian

Institution of Mechanical Engineers)

11:10am-11:40am: Special Keynote Address (Ogbeni (Engr.) Rauf Aregbesola,

Executive Governor of Osun State

11:40am – 12:20pm: Keynote Address (Prof. Onwalu, P, Director General, Raw Materials

Research and Development Council)

12:20pm – 12:30pm Remark from Deputy Dean, Sch. of Engrg – Dr. Agboje 12:30pm – 12:40pm: Vote of Thanks (Prof. F.A Oyawale, Chairman (LOC))

12:40pm – 12:45pm: Closing Prayer (Dr. Ajayi, O.O) 12:45pm – 1:00pm: Group Photograph/Departure

1:00pm – 3:00pm: Lunch Break/Exhibition of Students Projects

3:00pm - 5:00pm: Plenary session 2

3:00pm – 5:00pm: First Concurrent Session

**Technical Session A** 

THEME FOCUS: CONTEMPORARY ENGINEERING MANAGEMENT

Tract 1 Building Services

Venue: 500 Lecture Hall, Mechanical Engineering Department Building

Chairman: Prof. T.O. Mosaku Secretary: Dr. S.T. Adedokun

Rapporteurs: Mr. Banjo Solomon & Mr. Abidakun, O.A.

**Speakers/Papers:** 

Paper A1: Mr. Adekeye, Engr. S.O. Oyedepo & Oyebanji

Design & Development of Vapour Absorption Refrigeration System

for Rural Dwellers.

Paper A2: P.O. Babalola

Electromechanical Systems in Building Services Engineering

Paper A3:

Paper A4:

Track 2 Applied Mechanics/Management

Venue: Computer Lab, Mechanical Engineering Department Building

Chairman: Dr. Osheku, C.A

Secretary: Dr. R.J.O Ekeocha

Rapporteurs: Engr. Oyebanji, J.A & Mr. Ocheja, J.P

Paper A5: Razak I. Adeniji and Olawale O.E. Ajibola

Resolving Energy Crisis through Communication: The Case of

PHCN.

Paper A6: Olateju O.I, Oyeobu A.J and Nwatulegwu B.I

Effects of project management techniques on primary health care

delivery

Paper A7: Diji, C.J.

Sustainability Assessment of Electricity Production and

Consumption in Nigeria

Paper A8: Loto M.A. & Ojakinwa TB

Human Capital Formation Technological Diffusion and Economic Growth In Sub-Saharan African Countries: Evidence From Panel

Data Analysis

Paper A9: OLATEJU O.I, HOTEPO O.M and OYEOBU A.J

An evaluation of total quality management practices on business

performance of the Nigerian telecommunication sector

Paper A10: Alamutu S.A, Hotepo O.M, Oyeobu A.J and Nwatulegwu B.I

An evaluation of total quality management practices on business performance of the Nigerian telecommunications sector: a case study

of MTN Nigeria Limited

Paper A11: Olateju, O.I, Olateju, R.O and Mohammed, T.O

Effects of project management techniques on the performance of the

oil sector

Track 3 Mechatronics

Venue: Conference Room, Mechanical Engineering Department Building

Chairman: Prof. Katende, J Secretary: Engr. R. O Leramo

Rapporteurs: Engr. Omotosho, O.A & Mr. Babarinde Taiwo

**Speakers/Papers:** 

Paper A11: Aru, O.E and Opara, F.K.

Applying intelligent Systems in medical Diagnosis

Paper A12: C. A. Bolu

Integrating Mechatronics into Mechanical Engineering Curriculum in

Nigeria

Paper A13: V.O.S. Olunloyo, O.O.E. Ajibola and O. Ibidapo-Obe

Active fuzzy control of tall civil engineering structures

DAY THREE: Wednesday, November 14, 2012

9:00am – 12:00pm: <u>Second Concurrent Session</u>

### **Technical Session B**

THEME FOCUS: CLEAN TECHNOLOGY AND ENVIRONMENTAL SCIENCE

& TECHNOLOGY

<u>Tract 1</u> <u>Clean Technology/Environmental Science & Technology</u>

Venue: CNC Lab, Mechanical Engineering Department Building

Chairman: Engr. Awoyele

Secretary: Engr. O.S. Ohunakin

Rapporteurs: Mr. Gbenebor, P.O & Mr. Abioye, P.O

**Speakers/Papers:** 

Paper B1: Engr. Abolarin, T.S

Identification of Major Noise Donors, A Sure Way To Abating

Noise.

Paper B2: Antai E.E

Environmental Liquid Effluent, a Novel Approach for Treatment Of

**Industrial Waste Water** 

Paper B3: Olukani D.O and Akinyinka O.N

Environment Health and Wealth: Towards Analysis of Municipal

Waste Management in Ota

Paper B4: Ovri J.E.O

Design and Construction of an Anearobic Digester for the Production

of Biogas

Paper B5: Ekpeni L.E.N. and Olabi A.G.

Homogenisation In High Pressure Homogenizer (HPH) - A Deviced

Technique for Biomass Conversion in Biogas

Paper B6: Inegbenebor, A.I., Aruwajoye I.O. and Inegbenebor, A.O.

Evaluation of homogeneity from ore-bodied in Nigeria for secondary

mineral prospective

Paper B7: Babalola P.O.

Design and construction of parabolic solar heater using polymer

matrix composite

Paper B8: Tunde F. Adepoju, Adeyinka O. Adetunji, Emmanuel M. A.

Olatunji and Bello J. Olatunde

HCME: An environment-friendly I.C. engine fuel

Paper B9: Ogunsina, B.S, Ojolo S.J, Ohunakin, O.S, Oyedeji, O.A,

Matanmi, K.A

Potentials for generating alternative fuels from empty palm fruit

bunches by pyrolysis

Track 2 Nanoscience and Materials

Venue: 300 Lecture Hall, Mechanical Engineering Department Building

Chairman: Engr. Prof. C.A Loto Secretary: Engr. J.O. Okeniyi

Rapporteurs: Mr. Ajayi, C.O & Mrs. Joseph, O.O

Speakers/Papers:

# Inhibitive effect of ferrous gluconate on the electrochemical corrosion of aluminium alloy in H<sub>2</sub>SO<sub>4</sub> solution

O Sanni<sup>(1)</sup>, A.P.I. Popoola<sup>(1)</sup>, C.A. Loto<sup>(2)</sup>

<sup>1</sup>Department of Chemical and Metallurgical Engineering, Tshwane University of Technology, Pretoria, South Africa

<sup>2</sup>Department of Mechanical Engineering, Covenant University, Ota, Nigeria \*E-mail address: tayo.sanni@yahoo.com

#### Abstract

The use of ferrous gluconate as corrosion inhibitor on aluminium alloy in  $0.5M\ H_2SO_4$  solution was studied using gravimetric and potentiodynamic polarization measurements. The surface morphology of the aluminium alloy was studied after exposure to  $0.5\ M\ H_2SO_4$  solution in the presence and absence of inhibitor using high resolution scanning electron microscopy equipped with energy dispersive spectroscopy (HRSEM – EDS). The adsorption behaviour of the inhibitor was investigated. The results of the investigation show that increase in concentration of ferrous gluconate corresponds to an improvement on inhibition efficiency. Equally, the results showed the ferrous gluconate to be an effective corrosion inhibitor for the aluminium in the acidic medium. The results obtained from the two methods used were found to correlate with each other.

Key words: Corrosion test, Ferrous gluconate, Inhibition efficiency, Adsorption

#### 1. Introduction

Corrosion of metals/alloys can be defined as the deterioration or disintegration of materials due to their interaction with the environment. The subject has continued to receive attention over the years. Corrosion scientists are relentless in seeking better and more efficient ways of combating the corrosion of metals /alloys [Fontana, 1987].

Aluminium and its alloys are generally light, cheap, good conductors of heat and electricity and resist corrosion at moderate temperatures. They are therefore used widely as materials for cooking utensils, electricity cables, bottle tops, food and beverage containers, roofing sheets [Uppal and Bhatia, 2001]. Bottle tops of most alcoholic and non-alcoholic drinks, industrial machine parts are found to corrode rapidly in moist air thus constituting a health hazard to the end users. Although the oil and gas, beverage and metallurgical industries sink a large sum of money in an attempt to control corrosion of their engine parts and products, however, the problem still persist. In some chemical industries, equipment becomes corrosive after few years. In view of this, the need to research into the field of corrosion inhibition becomes necessary [Onen et al, 2010].

Inhibitors are chemical compounds that, when added to a fluid or gas decreases the corrosion rate of the metal or an alloy [Asuke, 2008]. The effectiveness of a corrosion inhibitor is a function of many factors like: fluid composition, quantity of water and flow regime [Asuke, 2008; Scamans et al, 1989; Schmitt, 1984]. In the oil extraction and processing industries, inhibitors have always been considered to be one of the defences against corrosion [Thomas, 1980; Fontana and Greene, 1987].

Various methods namely weight loss and gasometric [Ekpe et al, 1995; Ita et al, 1997; Ebenso et al 2004; El-Naggar, 2007; Ait Chikh et al, 2005; Ebenso et al, 1999; Ekpe et al, 2001; Obot et al, 2010; Ebenso et al, 2008], electrochemical and analytical [Ait Chikh et al, 2005] and polarization [Abdulwahab et al, 2012] have been employed in the determination of corrosion rates and inhibition studies. There have been several studies on corrosion inhibition of aluminium, mild steel, copper, and zinc in acidic and other medium. Some corrosion inhibitors such as synthetic compounds [Ait Chikh et al, 2005; Ebenso et al, 1999; Ekpe et al, 20011], natural products [Obot et al 2010] and dyes [Ebenso et al, 2004; Ebenso et al, 2008] have been investigated and reported as good corrosion inhibitors. In this work, the use of

ferrous gluconate (FG) as corrosion inhibitor was investigated for aluminium alloy in sulphuric acid solution using gravimetric and potentiodynamic polarization methods

#### 2. Experimental methods

#### 2.1 Materials and Methods

As – received aluminium alloy of dimension  $12 ext{ x}$   $12 ext{ x}$   $2 ext{ mm}$  with chemical composition shown in Table 1 was used. A 3.0mm diameter hole was drilled about 5 mm from the top of the 12 mm edge. The gravimetric test specimens were

degreased in ethanol, dried, weighed and stored in desiccators for further tests. Selected specimens were connected to an insulated flexible wire and cold mounted in methyl methacrylate resin. They were subsequently used for potential measurement. A concentration of 0.5M  $\rm H_2SO_4$  was prepared as required for the experiment. FG as inhibitor was used in  $\rm H_2SO_4$  medium. The molecular structure of the inhibitor is presented in Figure 1. The experiment was conducted at  $28^{\circ}C$ .

Table 1: Chemical composition of the aluminium used.

Si(%)	Fe(%)	Cu(%)	Mn(%)	Mg(%)	Zn(%)	Ni(%)	Cr(%)	Ti(%)	Ag(%)
0.157	0.282	0.0025	0.024	0.51	<0.0010	<0.0010	0.023	0.0046	<0.0001

B(%)	Be(%)	Bi(%)	Ca(%)	Cd(%)	Co(%)	Li(%)	Na(%)	p(%)	Pb(%)
0.0007	<0.0001	<0.0010	0.0011	0.0005	<0.0010	<0.0002	0.0005	<0.0010	<0.0005

Sn(%)	Sr(%)	V(%)	Zr(%)	AI(%)
<0.0010	<0.0001	0.0035	0.002	99

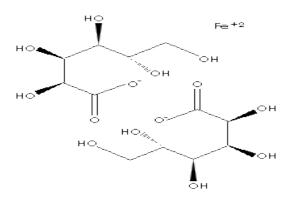

Figure 1: Molecular structure of ferrous gluconate

#### 2.2 Gravimetric measurements

Corrosion test was carried out on the previous weighed samples in the presence and absence of inhibitor and one of the samples was used as control (i.e. without inhibitor) while other samples were with inhibitor. The ferrous gluconate was dissolved in  $0.5 \, M \, H_2 SO_4$ , the

experiment was repeated with varying concentration of inhibitor (0.5 - 2.0) % g/v.

For each experiment, the samples were washed, dried and weighed over a period of twenty – eight days. The weight loss measurements were taken at an interval of 48h. The corrosion rate, degree of surface coverage and inhibitor efficiency were determined. The weight loss was determined by finding the difference between the initial weight of the samples and the final weight after 48 h using the equation below

$$W = W_O - W_F$$

Where:

W = weight loss in mg,  $W_O$ = initial weight,  $W_F$ = final weight.

The corrosion rate was determined in millimeter per year (mm/yr)

$$CR \qquad (mm/yr) \qquad = \qquad \frac{87.6W}{DAT}$$

(2)

Where W = weight loss in mg, D = density of the materials in g/cm<sup>3</sup>, T = time of exposure in hours and A = area of specimen in cm<sup>2</sup>

The degree of coverage and efficiency of the inhibitor was determined using the relationship reported elsewhere [Halambek et al, 2010]

#### 2.3 Electrochemical measurement

The potentiodynamic polarization techniques were used to evaluate the corrosion rate of the aluminium alloy in FG-H<sub>2</sub>SO<sub>4</sub> solution. All electrochemical measurements were obtained using Autolab frequency response analyzer (FRA) coupled to potentiostat and connected to a computer system as source of data acquisition. A standard corrosion cell was used as described elsewhere [Abdulwahab et al, 2012]; saturated Ag/Ag reference electrode and aluminium sample as working electrode were used for the electrochemical study. The working electrode samples were positioned at the glass corrosion cell kit, leaving 1 cm<sup>2</sup> surfaces in contact with the solution. Polarization test was carried out at 28°C in 0.5 M H<sub>2</sub>SO<sub>4</sub> solution using a 668 VA AUTOLAB potentiostat with 1.8 NOVA software package; a scan rate of 0.0016V/sec was used. From the Tafel corrosion analysis, the corrosion rate, potential and linear polarization resistance data were obtained in a static solution.

#### 2.4 Surface morphology

The as – received and as – corroded aluminium alloy surfaces were examined with high resolution scanning electron microscopy equipped with energy dispersive spectroscopy (HR SEM/EDS) Model : (Joel JSM – 7600F) was used to assess the surface of the corroded samples.

#### 3. Results and discussion

#### 3.1 Weight loss measurement

The results obtained for the variation of corrosion rate, inhibition efficiency and degree of surface coverage with exposure time for the aluminium alloy specimens immersed in 0.5 M sulphuric acid with varied concentrations of FG are represented in Figures 2 and 3.

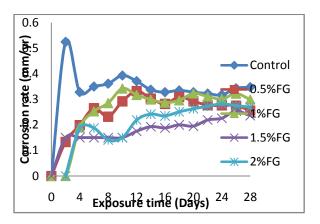

Figure 2: Variation of corrosion rate with exposure time for the aluminium specimen immersed in sulphuric acid for different concentration of inhibitor.

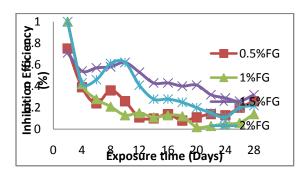

Figure 3: Variation of inhibition efficiency with exposure time for the aluminium specimen immersed in sulphuric acid for different concentration of inhibitor.

The corrosion rates of the aluminium coupons in  $0.5M\ H_2SO_4$  in the presence and absence of different concentrations of inhibitor (FG) were determined using equation 2. The results obtained are presented in Figure 2. The corrosion rates decreased with addition of ferrous gluconate. This indicates that (FG) in the solution inhibits the corrosion of aluminium in acidic medium and that the extent of corrosion inhibition depends on the amount of the ferrous gluconate present.

The percentage inhibitor efficiency shown in Figure 3 shows the variation of inhibitor efficiency with time at different concentrations of the inhibitor. The inhibition efficiency decreases with increase in exposure time with final values of 26%, 14%, 32%, and 22% when inhibitor concentration was increased from 0.5% to 2% with 0.5% incremental range. It shows that

percentage inhibition efficiency of ferrous gluconate progressively decreases with increase in time of exposure.

#### 3.2 Potentiodynamic polarization

The potentiodynamic polarization measurement for aluminium alloy in 0.5 M H<sub>2</sub>SO<sub>4</sub>/ferrous gluconate is presented in Table 2. Potentiodynamic polarization –corrosion rate (PP-CR), potentiodynamic polarization corrosion density (PP-Icorr) and linear polarization resistance (LPR) data were used as criteria for evaluation of corrosion resistance of aluminium alloy in the medium.

Table 1: Electrochemical corrosion data obtained for aluminium alloy in 0.5 M  $H_2SO_4$ - varying concentration of ferrous gluconate at  $28^{\circ}C$ .

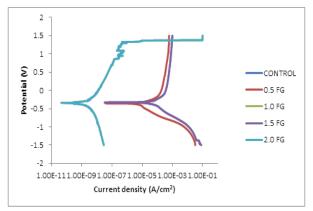

Figure 4: Linear polarization of aluminium in  $0.5M\ H_2SO_4$  solution / ferrous gluconate environment at  $28^{\circ}C$ . Figure 4 shows the polarization curves for  $0.5\ M\ H_2SO_4$ -Ferrous gluconate. The environment demonstrated a decrease in the corrosion rate and current density with

While the corrosion potential (Ecorr) and polarization resistance increases with inhibitor

addition of the inhibitor.

concentrations. The trend in the corrosion under this study is similar with the previous report [Abdulwahab et al, 2012]. The inhibited aluminium in 0.5M  $H_2SO_4$  –Ferrous gluconate revealed that corrosion rate decreases from 0.17571 mm/yr to 0.138, 0.000206 and 0.000197 at 1.5% g/v, 0.5% g/v,1.0% g/v and 2.0% g/v ferrous gluconate. Corrosion rate of aluminium alloy – $H_2SO_4$  is lower in 2.0% g/v and 1.0%g/v ferrous gluconate when compared to 0.5% g/v and 1.5% g/v respectively. Also, the changes in anodic and cathodic region suggest the mixed –type corrosion inhibition for aluminium alloy-0.5M  $H_2SO_4$ /ferrous gluconate.

#### 3.3. Corroded surface analysis

The SEM microstructure of aluminium surface is shown in Figure 5 to 6. The as - received aluminium alloy sample Figure 6, shows that ferrous gluconate was able to exhibit some degrees of inhibition which retard the corrosion rate of aluminium in  $H_2SO_4$  solution.

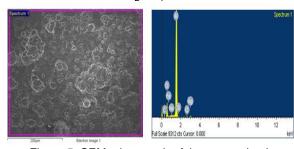

Figure 5: SEM micrograph of the as-received aluminium sample with the EDS spectrum

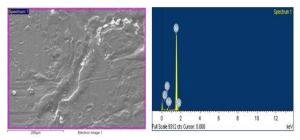

Figure 6: SEM micrograph of aluminium in 1.0%g/v ferrous gluconate in 0.5M H<sub>2</sub>SO<sub>4</sub> with the EDS spectrum

# 3.4. Efficiency of Inhibitor and adsorption isotherms

The percentage inhibitor efficiency (%IE) of the aluminium alloy –ferrous gluconate in H<sub>2</sub>SO<sub>4</sub> solution was computed using the equation reported elsewhere [Halambek et al, 2010] .The

computed data for the IE using potentiodynamic polarization corrosion rate (PP-CR), potentiodynamic polarization-corrosion density (PP-Icorr), linear polarization resistance (LPR) and gravitational method (GM) are presented in Figure 7 for 0.5M H<sub>2</sub>SO<sub>4</sub>/ferrous gluconate. The result revealed that the highest %IE of ferrous gluconate was achieved at 1.0 and 2.0%g/v and there was a correlation in all the methods used. The adsorption mechanism was shown from the variation between  $\log \theta$  with  $\log C$  indicating linearity for the environment and the adsorption behavior is believed to have obeyed Freundlich adsorption isotherm.

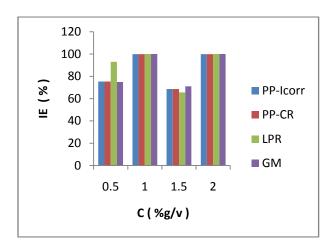

Figure 8: Comparism of inhibitor efficiency (IE) for 0.5M  $H_2SO_4$  solution / ferrous gluconate concentration obtained from gravimetric method and potentiodynamic polarization.

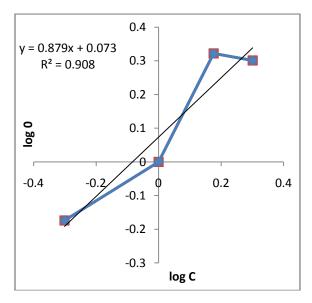

Figure 9: Freundlich isotherm for the adsorption of ferrous gluconate on the aluminium alloy in 0.5 M  $H_2SO_4$  solution obtained from gravimetric method at  $28^{\circ}C$ .

#### 4. Conclusion

The deductions from the experimental investigations show that ferrous gluconate (FG) acts as a good inhibitor for the corrosion of aluminium in  $0.5M\ H_2SO_4$  because the inhibitor was able to reduce the corrosion rate. Potentiodynamic polarization curves reveals that ferrous gluconate is a mixed – type inhibitor. The adsorption of ferrous gluconate follows Freundlich adsorption isotherm.
