

***IN-VITRO* AND MOLECULAR STUDIES ON THE RESISTANCE  
OF *P. falciparum* TO ANTIMALARIAL DRUGS IN OGUN STATE,  
SOUTHWESTERN NIGERIA**

**BY**

**OLASEHINDE GRACE IYABO  
B.Sc (HONS) Unilorin; M.Sc (Unilag)**

A THESIS SUBMITTED TO THE DEPARTMENT OF BIOLOGICAL  
SCIENCES, COLLEGE OF SCIENCE AND TECHNOLOGY  
COVENANT UNIVERSITY, OTA,  
NIGERIA

**IN PARTIAL FULFILMENT OF THE REQUIREMENT  
FOR THE AWARD OF THE DEGREE OF DOCTOR OF PHILOSOPHY  
(Ph.D) IN MICROBIOLOGY**

**2010**

## CERTIFICATION

We certify that this is an original research study by OLASEHINDE Grace Iyabo, for the award of Ph.D in Microbiology in the Department of Biological Sciences, Covenant University, Ota, Nigeria.

## **DEDICATION**

**This Ph.D work is dedicated to The Almighty God, The giver of all knowledge and wisdom.**

## ACKNOWLEDGEMENTS

‘Except the Lord builds a house, the builders labour in vain’. I return all thanks to the Almighty God for his mercies, faithfulness, grace, favour and inspiration that I enjoyed during the course of this Ph.D programme. To him alone is all glory for a successful completion.

I profoundly acknowledge the Chancellor of Covenant University for his spiritual motivation and for providing such an enabling environment from which I have benefited. I wish to express my profound gratitude to the management of Covenant University under the leadership of Prof. (Mrs) Aize Obayan for the support, advice and encouragement while the programme lasted.

My sincere appreciation goes to my chief supervisor, Professor A.O. Adeyeba for his awesome contributions, fatherly advice, thorough supervision and mentorship roles while on the research programme. I am privileged to have studied under his tutelage, most especially I want to appreciate him for handing me over to Dr. Olusola Ojurongbe to take on the supervision when he was indisposed. I pray God for the speedy restoration of his health. I am sincerely grateful to my supervisor, Dr. Ojurongbe for his useful advice, guided supervision and timely encouragement. He came to my rescue when I would have been stranded. I am most grateful. I also want to appreciate Prof. Louis O. Egwari and Dr. O.E. Fagade who jointly co-supervised this work. I am indebted to their thoroughness and eagle eyes that shaped this work.

I profoundly appreciate the Third World Organisation for Women in Science-Third World Academy of Science (TWOWS-TWAS) for granting me the 2007 TWAS-TWOWS postgraduate research fellowship award which was utilized at the National Institute of Malaria Research, New (NIMR) Delhi, India. I greatly appreciate the intellectual, material and financial contributions of TWOWS, TWAS and NIMR. I will forever be grateful for the invaluable contributions of Dr. Neena Valecha, my host supervisor in India, Dr. Anup Anvikar, the Head of malaria parasite bank and cell culture laboratories, Dr. Ruchi Singh of Molecular biology laboratories and Dr. Pillai for useful advice care and. My special appreciation also goes to all the staff and students of Microscopy laboratories, Parasite bank and molecular biology laboratories for all their love and

support while I was in India. Special thanks to Mallick Prashant and Joy for their kind assistance while I was in the molecular biology laboratories of NIMR, in India.

My sincere appreciation goes to the Dean of College of Science and Technology, Prof. James Katende for his fatherly advice. Special thanks to the entire members of staff of Biological Sciences Department, my HOD, Dr. S.N. Chinedu for his words of encouragement, Dr. (Mrs) A.A. Ajayi, my senior colleague, mentor and friend for her understanding and for filling in the gap for me while I was away on this research work, Dr. O.O Obembe for his encouragement and advice, Mr O. Taiwo, Mr R.O. Ishola, Dr and Mrs Jide Adekeye and Miss Opeyemi Abegunde for their technical support and assistance during the course of this work. Special thanks to Mr. Enoch Alabi for his professional advice on the arrangement and printing of this work. May God bless you all.

My profound gratitude goes to my brothers and sisters, Dr. and Mrs Henry Owolabi, Mr. and Mrs Victor Owolabi, Mr and Mrs J.J. Dada, Engr. & Mrs Femi Owolabi and Mr. and Mrs A. Adebiyi for their love, prayers and words of encouragement to make sure that this Ph.D work is an accomplished mission. Many thanks to my late dad, Chief John A. Owolabi whose wish has now being accomplished. I shall forever be grateful to my sweet mummy, Mrs Alice E. Owolabi for her constant prayers love and support in making sure that we get the best out of life. I sincerely appreciate my uncle's wife and mentor, Dr. (Mrs) A.O. Adedayo for her encouragement, love and prayers. I deeply appreciate my in-laws, the entire Olasehinde for their understanding, moral support, prayers and encouragement. I sincerely appreciate my darling husband, Pastor Lawrence Olasehinde, for his deep understanding, patience, love, spiritual and financial backing even when I had to leave my family to ensure the completion of this work. Many thanks to our dear children: Esther, Joseph and Daniel for their love, understanding, for being peaceful children, for their prayers and support. I deeply appreciate everyone who rendered assistance to me in the course of this work who for time and space could not be mentioned in this text. May God bless and reward you all in Jesus name. I ascribe all glory and honor to the Almighty God for the success of this research.

*Grace*

## ABSTRACT

The widespread of drug resistant *Plasmodium falciparum* has led to a rise in malaria-associated mortality most especially in sub-Saharan Africa. *In-vitro* and molecular studies were carried out in order to determine the resistant pattern of *P. falciparum* to antimalarial drugs and some local antimalarial herbs in Ogun State, Southwestern Nigeria. Prevalence of *falciparum* malaria was determined by microscopic examination of Giemsa-stained blood samples of patients who presented with fever in selected State Hospitals in Ogun State. Antimalarial drug sensitivity of one hundred (100) *P. falciparum* isolates to chloroquine, amodiaquine, mefloquine, quinine, sulphadoxine/pyrimethamine, artesunate and three local antimalarial herbs: *Momordica charantia* (Ejirin,) *Diospyros monbuttensis* (Eegun eja) and *Morinda lucida* (Oruwo) was determined using the *in-vitro* microtest (Mark III) technique. For molecular studies and genotyping, DNA was extracted from patient blood using the QiaAmp DNA Blood Minikit extraction method. Nested Polymerase Chain Reaction followed by Restriction Fragment Length Polymorphisms (PCR/RFLP) were used for the detection of *P. falciparum* chloroquine resistance transporter (*Pfcr*), *P. falciparum* multidrug resistance 1 (*pfmdr1*), *P. falciparum* dihydrofolate reductase (*Pfdhfr*), *P. falciparum* dihydropteroate synthase (*Pfdhps*) and *P. falciparum* sarco/endoplasmic reticulum calcium-dependent ATPase (SERCA) *PfATPase6* genes. Genetic diversity of the isolates was determined using merozoite surface proteins 1 and 2 (*m*sp1 and *m*sp2) and Glutamate rich Protein (Glurp). Structured Questionnaires were administered to patients or/and parents of infants to determine the factors that could lead to the development of drug resistance by the parasite in the study population. Out of 4066 subjects screened during the period of study, 2550 (61.1%) were positive. Highest prevalence (72%) was recorded in children 1-5 years while the same group also had the highest parasitaemia of 1080. All the isolates tested were sensitive to Quinine, Mefloquine and Artesunate. Only 51% of the isolates were resistant to chloroquine, 13% to amodiaquine and 5% to sulphadoxine pyrimethamine respectively. Highest resistance to chloroquine (68.9%) was recorded among isolates from Yewa zone while highest resistance to amodiaquine (30%) was observed in Ijebu zone. Highest resistance to sulphadoxine and pyrimethamine was recorded in Yewa and Egba zones respectively. A significant positive correlation was observed between the responses to artemisinin and mefloquine ( $P=0.001$ ), artemisinin and quinine ( $P=0.05$ ), Quinine and mefloquine ( $P= 0.01$ ). A significant negative correlation was observed between the responses to chloroquine and mefloquine ( $P=0.05$ ). For the local herbs highest

antiplasmodial activity was obtained with the ethanolic extract of *Diospyros monbuttensis* ( $IC_{50} = 32 \mu\text{g/ml}$ ). *P. falciparum* isolates analyzed during this study have demonstrated highly diverse nature of field isolates in respect of *m*sp-1 (block 2) and *m*sp-2 (central repeat region, block3). All the three reported families of *m*sp-1(K1, MAD20 and RO33) and two of *m*sp-2 (FC27 and 3D7) were observed among the isolates. Proportion of isolates with K1 family was 68% with 4 alleles in the range of 100 to 300 basepairs (bp). Proportion of isolates with MAD20 family was 40% and a total of 3 alleles were observed within 100 to 300 bp. RO33 proportion was 20% and the family was observed to be monomorphic with an allele size of 200 bp. In *m*sp-2 the proportion of FC27 family was 76% and that of 3D7 was 56%. Proportional Prevalence of FC27 and 3D7 families was significantly different ( $\chi^2 = 16.5, P = 0.002$ ). Eighty percent of the isolates harbor the genes that code for Glutamate rich protein with size ranging between 700 and 900bp. *Pf*crt (K76T ) *Pf*mdr1 (*mdr 1* ) *Pf*dhfr (S108N), and *Pf*dhps (K540E ) resistant genes were detected among the isolates while resistant SERCAP*Pf*ATPase6 gene which codes for artemisinin resistance was not detected in the population. The questionnaire study showed that 24.6% of the patient visit hospitals for treatment, 12.0% use local healers while 25.0% buy antimalarial drugs without prescription. It was also observed that some use more than one method in their management of malaria. Those who combined antimalarial drugs with traditional medicine from local healers were found to be 17.4%. Only 18% of the sample population used Insecticide treated mosquito nets, 42.3% use window and door nets while 13% do not employ any mosquito preventive method. Continuous use of the current antimalarial drugs increases the chance of resistance developing to those drugs. Control of drug use and reducing exposure of parasites to the drugs are most effective where the parasite is still sensitive to the drug. Molecular methods are most effective for monitoring the spread of resistant strains of *P. falciparum*.
