INTRODUCTION

A child falls ill with fever, diarrhea, and cough. Parents are worried; they need information about the symptoms and how to treat them.

Healthcare in many countries is overwhelmingly concerned with treatment of disease. However, in a world where a person with a good health is a man can make health care more accessible for all because "health" has different meanings in different countries and cultures. The concept of "health" varies widely, and what is considered healthy in one culture may not be in another.

The World Health Organization (WHO) emphasizes that health is not just the absence of disease but also the ability to lead a full and productive life. Therefore, the ability to access and use health care services is crucial.

The introduction of "Voice by Voice" technology enables people in remote areas to access healthcare information and services, even without access to traditional healthcare facilities.

ABSTRACT

An architecture for a voice-enabled healthcare system

Keywords: Architecture, Voice by Voice, Voice Application, Health Care, Health, Health by Voice

Medicaid

The Affordable Care Act (ACA) is an opportunity for people in developing nations whose access to healthcare is limited. It provides a universal healthcare system through nationalized health insurance. The act also includes provisions for increasing access to health care, including Medicaid, which expands Medicaid eligibility to cover more low-income individuals.

Technology (ICT) is now reaching every corner of the world, allowing people to access information and services from their homes.

Healthcare platforms

People read books and search websites using their smartphones and tablets to access health-related information.
