

**HOUSING TRANSFORMATION AND ITS IMPACT ON
NEIGHBOURHOODS IN SELECTED LOW-INCOME PUBLIC
HOUSING ESTATES IN LAGOS, NIGERIA**

A PhD Thesis

Submitted by

Egidario Bridgette ADUWO

MATRIC NO.-CUGP030006

In fulfillment of the requirements for the award of
A Doctor of Philosophy Degree (PhD) in Architecture,
The Department of Architecture, Covenant University,
Canaan land Ota, Ogun State Nigeria

2011

DECLARATION

I, hereby declare that this thesis entitled *Housing Transformation And Its Impact On Neighbourhoods In Selected Low-Income Public Housing Estates In Lagos, Nigeria*, was carried out by me- ADUWO Egidario Bridgette under the supervision of Prof. S. A. Amole. I affirm that this thesis has not been presented, either wholly or partly for any other degree in this or any other University.

All sources of scholarly information used in this thesis, to the best of my knowledge have been duly acknowledged.

DEDICATION

This thesis is dedicated to Almighty God who strengthened me throughout.

To my darling husband Engr. Ayodeji John Aduwo

and

My children Ofure, Oyindamola and Great Eromosele who literarily

went through the struggle with me.

CERTIFICATION

We, certify that, this thesis entitled *Housing Transformation And Its Impact on Neighbourhoods in Selected Low-income Public Housing Estates in Lagos, Nigeria*, was carried out by Egidario Bridgette ADUWO and meets all the regulations governing the award of the Degree of Doctor of Philosophy (PhD) in Architecture of the Covenant University, Ota, Ogun State, Nigeria. This work wholly or in part has not been submitted for the award of any other degree in this or any other University, and it is therefore approved for its contribution to knowledge and literary presentation.

ACKNOWLEDGEMENTS

I thank God Almighty who has led me to this point of triumph where I can sincerely appreciate His majesty and all those who He alone had used to propel me this far. I am completely aware that reaching this point has been made possible through massive encouragement and support received from diverse sources which helped to subdue an innate spirit of procrastination intended to steal God's glory.

Foremost amongst those the Lord has used to mould this budding destiny is the University Management led by delectable Prof Aize Obayan, the Vice Chancellor, who right from the onset believed that I could do it and was always there to give me support. She never spared a moment to think otherwise.

My thanks go to the immediate past Head, Department of Architecture, Prof E.A. Adeyemi for his relentless efforts in my favour when most needed. He, at his age, was ever committed in ensuring that this thesis was not abandoned half way.

I appreciate the brilliant contributions of my supervisor, Prof. S.A. Amole and his ever supportive wife, Dr. (Mrs) O.O. Amole, who took interest in my career far back in my undergraduate days. I am very grateful to you for your incredible humility, dedication, care and love shown to your students even in this savaged world.

My appreciation also goes to the pioneer Head of Department of Architecture, Dr. S.A. Daramola, who with so much concern always told me to push on despite some inevitable circumstances I found myself in the course of this research work. Prof. I.A. Okewole whose untiring moral support was immensely beneficial at the early stage of this work.

I acknowledge the special interest of Prof Solanke, the present Head of Department, who would always chip in a word of encouragement through mind- prodding parables to remind me of the fact that it is not over until it is over.

The immeasurable and highly appreciated support of my colleagues in the Department is applauded. Though we were all in this race together, they spared time to display a high level of interest in my progress. All of you have been wonderful in many ways and I wish you all well too. I particularly thank Dr. (Mrs.) Oluwatayo who took pains to teach me how to carry out the analysis of my data and trained me in the use of SPSS (Statistical Package For Social Sciences) soft -are package. She overhauled the

entire material to ensure that it is being presented appropriately. The readiness of the staff of centre for learning resources (CLR) to assist in accessing relevant information is commendable and I say thank you.

I must pay a glowing tribute to my darling husband, Engr. Ayodeji John Aduwo, who would only say a few but weighty words and supported me immensely financially and materially to ensure that I am comfortable enough to keep the fire burning, my parents for their prayers because they understood what it takes.

I thank God for the wonderful children Ofure Oluwatumise, Obehi Oyindamola and Eromosele Great Oluwatobiloba he blessed me with in the course of this study. They are indeed a blessing to me as they never set me back but only slowed the pace. It is unimaginable how even at their tender ages, they always understood when I said “mummy is busy please keep off”.

Above all, God has been too good to me. He provided for me, help wherever and whenever I needed it. I certainly cannot thank him enough.

APPENDIX	293

ABSTRACT

The study investigated housing Transformation and its impact on the neighbourhood in two selected public low- income housing estates in Lagos State. The analysis of the impact and extent of these Transformations on the houses and their attributes as well as their general consequences for the neighbourhoods was carried out.

The general approach to this study was exploratory and descriptive, based on both qualitative and quantitative research techniques because the qualitative enquiries helped to explore the diversities in a situation or phenomenon while the extent or magnitude was determined through the quantitative means. The survey method was employed using questionnaires. The respondents were 614 residents of the housing estates, randomly selected from a total of 2,870 residents in the two estates. In addition, in-depth interviews were conducted as part of the qualitative data on 15 residents purposively selected. The data collected were subjected to statistical analyses using frequencies, percentages, cross tabulations, discriminant and factor analysis.

The results revealed that the Estates consisted of households with diverse social and economic backgrounds living together. This meant that over time, the estates had become heterogeneous in composition as against the original residents who were low-income earners. The result also showed that 75.7% of the total residents had transformed their houses and an average of 89% of the open spaces allocated to each housing unit had been built up there-by reducing the air circulation space around the housing units. The nature of transformation observed were mainly through the addition of more bedrooms either for private or commercial purposes, enlargement of some domestic interior spaces for convenience, conversion of existing dwelling spaces to shops and other forms of business outfits and outright reconstruction of an entire building. The process of transformation for most of the residents, as evident from the data, begins with the addition of more bedrooms followed by erection of perimeter fences with the majority sourcing for fund through personal savings.

The result of discriminant analysis revealed that twelve variables differentiated the residents who transformed from those who did not. The implication of this is that these variables can be used to predict some issues concerning the residents within the study areas. These variables included occupation of respondents (Wilk's Lambda = 0.001, $F_{(1, 145)} = 22049.87$; $p < 0.05$); present household size (Wilk's Lambda = 0.001, $F_{(1, 144)} = 21363.72$; $p < 0.05$); religion of respondents (Wilk's Lambda = 0.00, $F_{(1, 141)} = 42127.91$; $p < 0.05$), and accessibility (Wilk's Lambda = 0.03, $F_{(1, 149)} = 2622.80$; $p < 0.05$) of the Estates to other parts of the city amongst others.

It was discovered that the forms of transformations prevalent in these Low-Income housing Estates were mostly related to economic and social needs. The findings showed that the drive to make financial gains through different means was the highest motivator for the residents as huge amount of cash rewards are accrued from such efforts. The nature of transformations that had taken place were such that had been dictated by several factors including the types of housing, particularly the number of bedrooms and size of some of the interior spaces that were made available to this group of people.

Measuring the residents' reaction to certain types of transformation which were conspicuous in the study areas showed their acceptance level in spite of the services they presently render to the residents which was quite low. The study concluded that the housing estates had been transformed from homogeneous community to a heterogeneous community and that the neighbourhood had become mixed even in relation to land use.
