Congress Abstract

Three new compounds (1 – 3) were isolated from the whole plant of *Citrullus lanatus* (Cucurbitaceae). The structures of these compounds were characterized by MS, IR, 1D and 2D NMR. The DPPH radical scavenging property of these compounds as well as vitamin C which served as the positive control group was determined. The result showed that Compound 3 exhibited the highest scavenging activity with an EC₅₀ value of 0.34 mM while Compounds 1 and 2 showed scavenging activity of 0.52 and 5.37 mM respectively. The EC₅₀ value for vitamin C is 1.36 mM. The result therefore showed that Compounds 1 and 2 possess better scavenging property than vitamin C and thus may serve as potent antioxidant drugs in oxidative stress management.
