To cite this article:

Abstract: Most people know that academic performance generally refers to how well accomplishing his or her tasks and studies, but there are numbers of factors that determine quality of students' academic performance. This study investigated the effect of alcohol consumption on academic performance of undergraduate students. A survey research design was used. A pilot carried out with 30 students to validate and determine the psychometric properties of the questionnaire used in this study. Total of 200 respondents, 114 male and 86 females with ages ranging between 18 and 25 years participated in this study. Three hypotheses were tested using Pearson r, T-test, ANOVA, and regression analysis. The result revealed that there is a significant relationship between...
and academic performance ($R^2=0.74, P<.05$), there is a significant difference in academic performance of students that drink alcohol and those that do not ($R^2=12.22, P<.05$), there is a significant effect of alcohol consumption on academic performance ($R^2=4.474, P<.05$). The study has recommendations.

**1. Introduction**

In educational institutions, success is measured by academic performance, or how well a student meets the standard set out by institution. As career competition grows ever fiercer in the working world, the need for students doing well in school has caught the attention of parents, and employers. Education is the road to success in the working world, much effort is made to identify, evaluate, track and encourage the progress of students in schools. Parents care about their child’s academic performance because that good academic results will provide more career choices and job security. Performance is evaluated in a number of ways. For regular grading, students demonstrate their knowledge by taking written and oral tests, performing presentations, turning in homework and participating in class discussions. Academic achievement or (academic) performance is the outcome of education which a student, teacher or institution has achieved their educational goal. Academic achievement is commonly measured by examinations or continuous assessment but there is no general agreement...
best tested or which aspects are most important — procedural knowledge such as skills or declarative knowledge such as facts. (majkut@fas.harvard.edu). Students' academic gain and learning performance is influenced by numerous factors including gender, age, teaching faculty, students' schooling, father/guardian's socioeconomic status, what they consume, residential area of students, medium of instructions in schools, daily study hour and accommodation as hostels or day scholars. Many researchers conduct studies about the factors contributing to students' performance at different study levels. C suggested that a student's educational success is contingent on social status of students' guardian in the society. Considine and Zappala (2002) noticed the same that parent's income status positively affects the student test score in examination. According to Minnesota (2007), the education performance is depending upon the academic performance of graduate students. Dui quoted Staffolani and Bratti, (2002) observed that "the measurement of students previous outcomes are the most important indicators of students' future achievement, this refers to previous performance is, better and will predict the student's academic performance in future."

have been conducted in the area of students' achievement and these studies identified and number of factors that affect the academic performance of the student at school, college, university level. Their findings identified students' effort, previous schooling, parent's background, family income, self-motivation of students, age of student, learning preference and qualification of students as important factors that have effect on student's academic performance setting. The utility of these studies lies in the need to undertake corrective measures that academic performance of undergraduate students. It is generally assumed that the students better or higher performance in the starting classes of their studies also performed better in full years at degree level. Everyone can be surprised with this assumption if it could be proved. From the last two decades it has been noticed significantly that there is great addition in research material relating to indicators of academic achievement with much emphasis on whether traditional achievement measures of academic performance are best determined by academic gain at university or higher level. However, it is also observed the researchers do not agree with this viewpoint or statement. Reddy and Talcott (2006) discredited these assumptions that future academic gains are resolute by preceding performance. In their relationship between previous academic performance and subsequent achievement at university they found that students learning or studying at graduate level and the score secured did not predict academic achievement at university level. They also cited Pearson and Johnson (1978) who observed the whole grade association of only 0.28 graduate level marks and university degree achieved. Parent's socio-economic condition, which includes parents' academic and professional revenue and occupational affiliation, is also associated with academic gain of students. The researchers confirmed that academic achievement of students is contingent upon parent's socioeconomic condition. So the students belonging to higher socioeconomic backgrounds will perform better than students associated with low socioeconomic backgrounds. "Social and economical status is generally determined by combining parents' qualification, occupation and income standard."

Among many research studies conducted on academic achievement, it is not very surprising to Socio-economic status is one of the main elements studied while predicting academic performance. (1995) conducted a study on socio-economic status of the parents of students and concluded that economic background has a great impact on student’s academic performance, main source of imbalance among students and student’s academic success contingent very strongly on economic standard. Considine and Zappala (2002) also having the same views as Graetz (1995) study on the influence of social and economic disadvantage in the academic performance of so noticed, where the parents or guardians have social, educational and economical advances, strengthen the higher level success in future. But it is also noted that these parents make available psychological and emotional shore up to their children by providing good educational environment that produce confidence and the improvement of skills needed for success. O Pedrosa et.al (2006) in their study on social and educational background pointed out those mostly came from deprived socio-economic and educational background performed relatively others coming from higher socio-economic and educational area. They named this phenomenon as ‘elasticity. It is obvious and true that the criteria for categorizing socio-economic standard countries are different depending of their norms and values. The criteria for low socio-economic developed country will be different from the criteria of developing countries and same will be in developing and under developing countries. "The total income of families, monthly or annual expenditures also put a great effect on the learning and academic opportunities accessible to youth and their chances of educational success. Furthermore, he also pointed that due to residential segregation, the students belonging to low-income backgrounds usually attend schools with lower levels, and this situation reduced achievement motivation of the students and high risk of malfunction in future life endeavors" (Escarce, 2003).

Alcohol is a colorless, volatile, flammable liquid which is the intoxicating constituent of wine, beer, and other drinks. Alcohol is no ordinary commodity but a drug that can be depended upon (Gureje, 1998). Production and consumption of alcohol in the modern Nigeria is on the increase and the vol1 unrecorded due to illegal and local productions and the paucity of data on the legality of produ& mayowa 2011). World health organization (2004) ranked Nigeria among the thirty nations with highest per capita consumption of alcohol worldwide. The new drinking norms that have evolved competitions among youths. Bar owners, brewery’s representatives set out prizes for the fastest the winner is judged based on the quantity consumed (Odejide et al, 1987, 1999, 2006). In Ni star trek, guilder ultimate search and a host of others. In the universities there is a group known as kno club which uses palm wine as holy water. There can be lingering cognitive deficits up to 48 hours after a night of drinking. Heavy drinking by students can lead to positive blood alcohol levels the next day. Whether or not they even get up for class and, if they do, the quality of how information is ultimately stored. Sleeping off after a buzz is a common practice, it can interfere with the resulting in an increase in anxiety, jumpiness, and irritability the next day, and fatigue the d.
alcohol consumption has further-reaching effects on memory and learning ability", a Duke Un suggests, "intoxication is produced by temporary impairment of brain receptors key in creating memories in the hippocampus", said Jeff Georgi, a coordinator at the school's Alcohol Alert Program. "If you study for four hours...then go drinking, it affects this anchoring process," he said in The Chronicle. Alcohol also disrupts sleep, which interferes with long-term memory formation. In adults, research suggests that alcohol consumption is associated with memory deficits, and if you study for four hours...then go drinking, it affects this anchoring process. In some cases, the linkage between problem drinking and academic performance is profound. Drinking can affect the biological development of young people as school-related achievement and behavior. Serious alcohol use among youth has significant consequences. Alcohol damages areas of the brain responsible for learning and memory, and visual-spatial cognition. Diagnosticians often find that these skills in adolescents who drink are comparison to those who aren't drinking. Scientists know that alcohol problems are tied to lower attendance and decreases dropout rates. According to Fleming (1992) youth (undergraduate alcohol use to help them cope with academic stress, negative emotions and make them Students that use alcohol as a coping mechanism tend to indulge more always in the use of alcohol of the time apply defense mechanism by engaging in denial and rationalization. Almost one third of students admit to having missed a class, and failing a test/project because of alcohol (school According to FACTS ON TAP, an organization that specializes in educating college students about alcohol consumption, "159,000" of first year undergraduates drops out of school as a result of alcohol consumption, other related drugs.

2. Statement of Problem

If you take a closer look at what qualities it takes to have an excellent academic performance, that this are the qualities required to be successful in life, because to have a good academic performance to have to be consistent, determined, focused, then you can have a good academic performance reflects your abilities. Success on its own comes with lots of meanings and varies across individuals, however one's definition of success determines how he dreams and achieving it, nevertheless academic success is the primary and the major step one will likely vary, some level of happiness and financial stability which in some definition is already a success. How one defines success, having a good academic performance will be a boost in achieving it when are educated and have a degree that you will work in a company to some level of happiness and financial stability which in some definition is already a success. Alcohol consumption by students in the university has become unbearable. Alcohol poses danger to health but its negative effect on academic performance. Once in the ur group has a strong influence on the students' involvement with alcohol. Students instead of academic activity spend their precious time in social activity (alcohol). This leads to class mis tests, rape, unwanted pregnancies, vandalism, drunk driving and other types of crimes.

3. Hypotheses of the Study
There will be a significant positive relationship between alcohol consumption and academic performance.

There will be a significant difference in academic performance between users and non-users.

There will be a significant effect of alcohol consumption on academic performance.

**4. Method Design**

This study which examined the effect of alcohol on academic performance adopted a survey research design. The independent variable is alcohol consumption while the dependent variable is academic performance.

**4.1. Setting**

The study took place in Delta State University (DELSU), Delta State Nigeria. This is a convention where students have their independence (freedom). Some live in the hostel while others reside at home.

**4.2. Participants**

The participants were two hundred undergraduate students of Delta State University (DELSU). The age ranges from 15 to 29 years. There were 114 (57%) males and 86 (43%) females.

**4.3. Sampling Technique**

The purposeful sampling method was used to select the participants because of the nature of the study. It entails administering questionnaires to undergraduates that indulge in alcohol and those that do not.

**4.4. Instrument**

A structured questionnaire developed by the researcher (Cronbach Alpha coefficient of 0.78 and consistency of 0.86) was used to tap relevant information from the participants. The questionnaire consists of different sections with each of the sections collecting information on different interests. It comprised A, B, and C. The structure of the questionnaire is outlined below.

**4.5. Section A**

In this section of the questionnaire, demographic information of the participants was captured. This includes age, to their department and level of their study.

**4.6. Section B**

This instrument measured the drinking behavior, the quantity and type consumed by the participants.

**4.7. Section C**

This instrument measured the academic life and performance (CGPA) of the participants.

**4.8. Procedure for Data Collection**

The researcher randomly selected two hundred undergraduate students of Delta State University.
Delta state, Nigeria using simple random selection. The respondents cut across age, sex, de
level of study. The criteria for inclusion were; must be an undergraduate student of Delta Stc
and will be below thirty years of age. The respondents were approached, having acquainted
researcher's intention. The respondents consent was duly sought by asking them wheth
participate in the study and signing the consent form. Those who responded in the affirmative p
the study, while also at the same time requesting them to pick one ballot paper from the basket
them. Those who picked 'Yes' written on the card were drawn into the study while those that pic
excluded from the study. This procedure ensured that every participant was given equal c
participating in the study. Prior to given the questionnaires to them to fill, the researcher in:
on how they were expected to respond to the statements in the questionnaire (i.e., they should
in each statement and that the questionnaire should be filled completely as half filled questionn
rendered invalid). Additionally, the participants in the main study were informed that their
was guaranteed and therefore, they should not write their names on the questionnaires. They
albeit individually to mention any areas in the questionnaire they did not comprehend. They
the questionnaire was written in unambiguous language and therefore, they could respond to tl
in the questionnaire almost effortlessly on their own.

5. Statistical Analysis

Data generated in this study was analyzed using simple regression analysis, Pearson r, indepe
and Anova.

5.1. Result

This chapter discusses the analyses and presentation of results. For all the hypotheses tested
level of significance is 0.05. As stated in chapter three, the independent variable is alcohol con
the dependent variable is academic performance.

</tbody>
</table>

The result confirms that there is a significant effect of alcohol consumption on academic performance ($R=.691, R^2=4.474, P<.05$). The study has recommendations and limitations.

### 6. Discussion and Conclusion

All the hypotheses that were tested in this study were confirmed. It is evident that alcohol influences the academic performance of the consumer (Engs et al., 1996; Perkins, 1992; F1996a,b; Wechsler et al., 1994, 1998, 2000b). Undergraduates in the universities are no more guided by their parents and they are free to do whatever they choose. This is evident undergraduates run mad at the course of their academic sojourn and some even suffer memory finding it hard to graduate as their academic performance is always below pass mark (We2000b). Some as a result of their background associates with peers that will end up destroying themselves with alcohol because they want to belong among the big boys on campus. This is a serious issue, are regarded as future leaders are destroying themselves with alcohol, then how will...
Alcohol-related sexual assault is a common occurrence on college campuses. Although estimation and prevalence vary dramatically because different sources use different definitions, victims are unwilling to report sexual assaults to the police or other authorities, at least 50 percent of student sexual assaults are associated with alcohol use (Abbey, 1991, 2002; Abbey et al., Copenhaver and Grauerholz, 1991; Harrington and Leitenberg, 1994; Koss, 1992; Koss et al., and Marshall, 1987; Muehlenhard and Linton, 1987; Presley et al., 1997; Tyler et al., 1998). If alcohol is involved, acts meeting the legal definition of rape appear more likely to occur (1999). Even aside academic performance when undergraduates misuse alcohol, damage to environment or residence hall—including vomit and litter—are common after effects. (Enns 1994)

Recommendation

- There will be a continuous awareness program on the dangers of alcohol consumption on performance for undergraduates starting from freshmen to those in their final year.
- Promotional sales by alcohol companies will be prohibited in the higher institutions.
- Drinking joints and bars will not be allowed to operate within or around universities.
- Self esteem training will be carried out periodically, to let the undergraduates understand it not a self esteem booster.
- There will be a periodic alcohol level screening in the universities and a stiff penalty for wanting so as to deter others.
